TrustTails
Whitepaper

Trust, earned — not claimed. A community-first token on Solana with a fixed supply, revoked authorities, and a refusal to oversell.

VERSION 1.0 · $TAIL · BUILT ON SOLANA

Contract: 4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc

Contents

SECTION 01 · ORIGIN

More Than a Meme

The things that change how we relate to money rarely announce themselves as serious. They usually arrive looking like something else entirely.

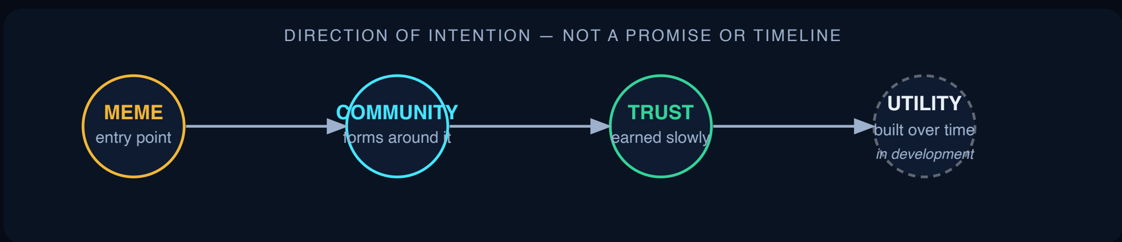
Bitcoin was a nine-page PDF posted to a cryptography mailing list that most recipients ignored. Dogecoin was created in 72 hours as a joke about internet trends, featuring a Shiba Inu and deliberately silly typography. Neither looked like infrastructure. Both became, in their own ways, entry points for millions of people who had never engaged with the underlying ideas before the meme gave them permission to pay attention.

TrustTails begins in the same spirit — honestly. The name is playful. The mascot is a dog. The community formed around something lighthearted. None of that is a mistake, and none of it is something to apologise for. A meme is not a ceiling; it is a door. It lowers the barrier to arrival. What happens after arrival is the question that matters.

The $TAIL coin — a community SPL token deployed on Solana with a fixed supply of 1,000,000,000, mint authority revoked and freeze authority revoked — exists today as exactly that: a door. It is verifiable on-chain at contract **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc**. No inflation. No team minting. No freeze capability. Those decisions were made and locked before this document was written.

But the honest version of this story is that locking a token supply is not the same as building something meaningful. It is a starting condition, not an achievement. What follows has to be earned — through the community that forms, the trust that accumulates slowly, and the utility that gets built carefully over time. That sequence cannot be rushed, and it will not be faked here.

> *The thesis of this document is simple: we started as a meme to get noticed. Everything after that has to be earned, not claimed. This whitepaper describes what we intend to build and is honest about what does not yet exist.*



The intended path: the meme is the entry point; everything beyond it must be earned. This diagram represents direction only — no dates or outcomes are implied.

That framing — honest about what is live, honest about what is being built, and honest about what is uncertain — is the tone this document holds from here forward. Readers who want certainty will not find it. Readers who want a clear-eyed view of what exists today, what the plan is, and where the unknowns sit, will.

FIXED TOTAL SUPPLY — MINT AUTHORITY REVOKED, ON-CHAIN TODAY

SECTION 02 · THE NAME

Trust + Tails: What We Stand For

The name is not an accident. It is a quiet argument — one we intend to spend years proving.

The crypto space has a long tradition of animal coins: dogs, cats, frogs, and now a fox with a tail. We leaned into that tradition deliberately, because leaning away from it would have been dishonest about what the early community is. TrustTails started as a meme — a way to get noticed in a crowded room. We say that openly, without apology, because the alternative is to pretend we arrived in the market as something serious and established. We did not. Most projects that matter did not either.

But a coin with "Trust" in its name has a different obligation than a coin with "Doge" or "Shib." You either earn the word or you wear it as a red flag. Every decision the team makes, every piece of documentation published, every thing we choose not to claim — those are the payments on that debt. The name is the standard we set for ourselves on day one, and it is the standard the community is entitled to hold us to.

Where the Name Comes From

"Tails" does the cultural work: it places TrustTails inside the recognisable tradition of community-driven tokens, signals approachability, and gives the project a mascot that can carry warmth and humour without undermining the underlying seriousness. "Trust" does the harder work. It names the thing that must be built — slowly, incrementally, in public — before any of the longer-term ambitions of the TAIL Network become real. You cannot shortcut trust. You can only accumulate it, or squander it.

Undersell and Overdeliver

There is a single operating principle that governs how TrustTails communicates: claim less than you have done, and do more than you have claimed. In a sector defined by promises made before products exist, we believe the opposite posture is both ethically correct and strategically sound. Investors who have been burned by overpromising are not won back by louder promises — they are won back by consistent, verifiable, quiet delivery.

> *The $TAIL coin is live on Solana today. Mint authority is revoked. Freeze authority is revoked. The contract is public and verifiable. That is what we can prove right now. Everything else — the TAIL Network, the long-term direction, the potential for broader relevance — must be earned. We will not pretend otherwise.*

What TrustTails stands for, in plain language, is this: a community that entered through a playful door and chose, at every fork since, to walk in a direction that justified the trust implied by the name. That choice is ongoing. It is never finished. And it is the only measure of this project that will matter in five years.

SECTION 03 · THE TOKEN

TAIL at a Glance

Before anything else was promised, the token was locked. That is the only fact that matters on day one.

$TAIL is a Solana SPL token. It was deployed with a fixed supply of one billion units — no more, ever — and within the same launch sequence, both the mint authority and the freeze authority were permanently revoked. These are not marketing statements. They are on-chain state changes, visible to anyone with an internet connection and the contract address.

Contract: **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc**

CHAIN	FIXED SUPPLY	MINT AUTHORITY	FREEZE AUTHORITY
Solana SPL Token Standard	**1,000,000,000** No additional issuance possible	**REVOKED**	**REVOKED**

$TAIL token parameters — verifiable on-chain via the public contract address

What Revoked Authorities Actually Mean

On Solana, a token's mint authority controls whether new supply can be created. A freeze authority controls whether token accounts can be locked, preventing holders from transferring their balance. When either authority is revoked, the action is irreversible — no future transaction, no team decision, and no external pressure can restore it.

In practical terms: no one can inflate the supply of $TAIL, and no one can freeze your wallet. The one billion tokens in existence today are the complete and final set. The team cannot create more to dilute holders, cannot issue tokens to reward undisclosed parties at a later date, and cannot selectively restrict who may transfer their balance.

> *Revoking mint and freeze authority is a deliberate structural constraint, not a feature that can be toggled back on. It removes a category of trust-based risk before that risk ever becomes a question.*

What This Does Not Guarantee

On-chain constraints speak to supply mechanics only. They say nothing about price, adoption, or the success of TAIL Network — the separate Layer-1 being built on the Cosmos SDK that represents the long-term infrastructure ambition of this project. That work is in development and is covered in its own section. The Solana $TAIL token is the starting point: a verifiable, community-accessible asset that exists today. Everything built from here has to be earned against that foundation.

Verifiable Now

Any holder can confirm supply, mint status, and freeze status on-chain at any time — no trust required.

Community Entry Point

$TAIL on Solana is how the community forms. It is the first layer, not the last one.

SECTION 04 · TOKENOMICS

Fixed by the Chain, Not a Promise

Most token projects ask you to trust a whitepaper. $TAIL asks you to read the chain.

The supply of $TAIL is not governed by a board resolution, a vesting schedule, or a founder's discretion. It is governed by code that can no longer be changed. When the mint authority for the $TAIL SPL token was revoked on Solana, the total supply of 1,000,000,000 tokens became a permanent fact — not a policy, not a commitment, a fact. No new $TAIL can ever be created. There is no inflation mechanism. There is no "reserve mint" waiting behind a multi-sig. The on-chain record is public and verifiable today at contract address 4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc.

The freeze authority has also been revoked. This means no central party — including the founding team — can freeze any holder's wallet. Tokens, once held, belong to the holder unconditionally.

Mint Authority

Revoked permanently. No new $TAIL tokens can be created under any circumstance, by any party.

Freeze Authority

Revoked permanently. No wallet holding $TAIL can be frozen or restricted by the issuing team.

Why This Matters: Inflation Is the Hidden Tax

Many token projects launch with promises of "controlled" inflation — new supply minted to fund development, reward validators, or sustain a treasury. The intent is sometimes legitimate. The effect, however, is always the same: existing holders are diluted. Each new token minted reduces the proportional claim of every existing holder. Fixed supply eliminates this entirely. The 1,000,000,000 $TAIL in existence today is the same number that will exist tomorrow, in a year, and on the day TAIL Network reaches mainnet.

This is not a marketing angle. It is a structural property of the Solana SPL standard combined with a revoked mint authority. It requires no ongoing enforcement, no audits of treasury behavior, and no trust in the team's self-restraint.

TOTAL $TAIL SUPPLY — FIXED ON-CHAIN

1,000,000,000 $TAIL — 100% in existence today

0 new tokens can ever be minted

Circulating supply (fixed)

Future minting (impossible — mint authority revoked)

The entire $TAIL supply — 1,000,000,000 tokens — was established at launch. The revoked mint authority makes any future issuance technically impossible. No allocation chart is shown because no allocation was withheld; the community distribution structure is described separately.

> *On-chain verification is always available. Contract:* ***4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc*** *on Solana. Mint authority: revoked. Freeze authority: revoked. Supply: 1,000,000,000. These are observable facts, not claims.*

1,000,000,000

FIXED SUPPLY — IMMUTABLE BY ON-CHAIN AUTHORITY REVOCATION

We do not publish a token allocation chart with invented percentages for "ecosystem," "team," "treasury," and "liquidity." We have not made those designations, and we will not fabricate them to look like more complete projects. What exists is the chain. What the chain says is what is true.

SECTION 05 · TRUST MODEL

The Trust Model: Revoked Authorities

Two on-chain actions — irreversible, public, permanent — form the entire foundation of what $TAIL asks you to trust.

Most conversations about token trust happen in Discord servers and marketing decks. The $TAIL trust model lives somewhere harder to fake: the Solana blockchain. Before explaining what was done, it is worth explaining what was at stake.

Mint Authority: The Power to Inflate

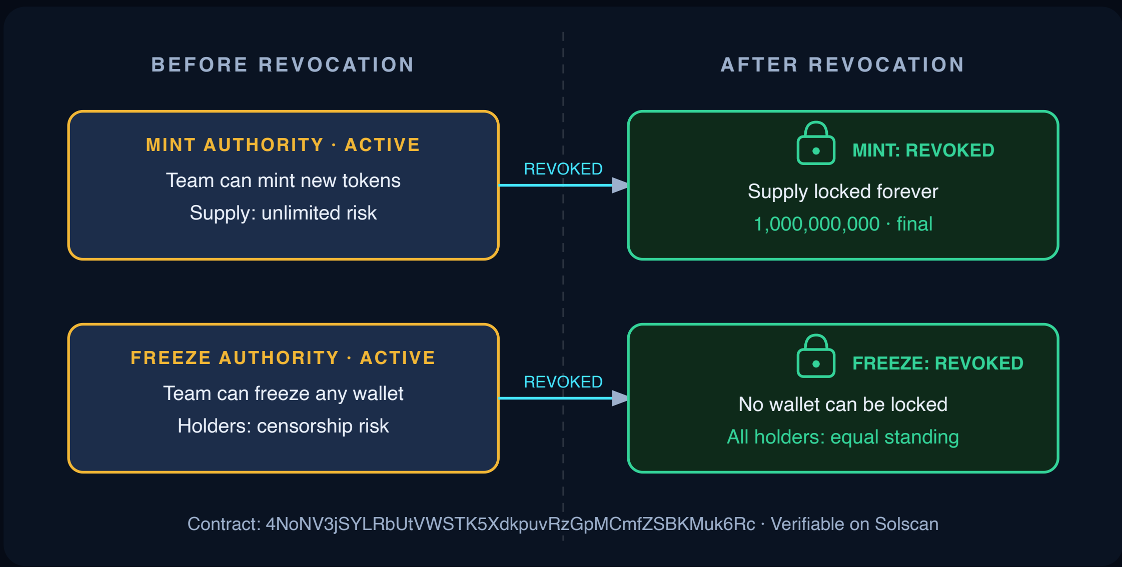
When a token is created on Solana, the creator holds a *mint authority* — a cryptographic key that permits the minting of new tokens at any time, in any quantity, without warning. As long as mint authority remains active, the stated supply is a number on a page, not a guarantee. A project that retains mint authority can double its supply overnight, diluting every holder silently and legally. This risk is not theoretical; it has been used to devastating effect across hundreds of Solana token projects.

For $TAIL, the mint authority has been permanently revoked. The total supply is fixed at exactly 1,000,000,000 tokens — one billion — and no mechanism exists, on-chain or off, to change that figure. Not by the founding team. Not by a future entity. Not by anyone. The instruction to revoke is a one-way door on the Solana protocol level; there is no "re-enable" function.

Freeze Authority: The Power to Censor

The second risk is less discussed but equally serious. A *freeze authority* permits the token issuer to freeze any individual wallet that holds the token — rendering that holder's balance immovable and untransferable without their consent or any judicial process. Projects that retain freeze authority hold a kind of financial veto over their own community. It creates an asymmetry of control that is fundamentally incompatible with a genuine community asset.

For $TAIL, the freeze authority has also been permanently revoked. No wallet can be frozen. No holder can be censored or locked out. Every participant holds their tokens under the same conditions.



Both mint and freeze authorities revoked at contract level — permanent, on-chain, independently verifiable.

What "Revoked" Actually Means

Revocation on Solana is not a policy statement or a promise to behave. It is a protocol-enforced state change. Once an authority is revoked, the signing key is destroyed. There is no multisig that could vote to restore it. There is no upgrade path. There is no court order that could compel the blockchain to undo it. Anyone with an internet connection can verify both revocations right now by looking up contract `4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc` on any Solana block explorer.

> *This is not a claim TrustTails makes. It is a fact the chain holds. The trust model for $TAIL does not require trusting the team — it requires trusting the Solana protocol, which has operated continuously since 2020.*

Fixed Supply

1,000,000,000 $TAIL tokens exist. No more can ever be created. Scarcity is enforced by code, not by intention.

No Censorship Vector

No wallet address can be frozen or blocked by any party. Every holder has identical, unrevocable access to their balance.

These two revocations do not make $TAIL valuable — value has to be earned through community, utility, and the long road of building TAIL Network. But they remove two of the most common and most damaging failure modes in early-stage token projects. They are the floor. Everything else is what gets built on top of it.

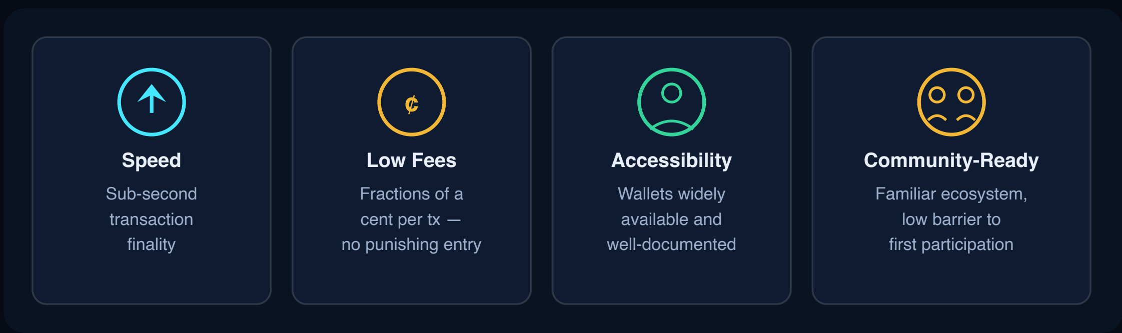
SECTION 06 · WHY SOLANA

Why the $TAIL Coin Launched on Solana

Every community has to start somewhere. The question is not which chain is philosophically perfect — it is which chain makes it easiest for real people to show up on day one.

When the $TAIL coin was minted, the goal was straightforward: create a verifiable, tamper-proof token that anyone with a wallet could hold, with no back doors left open. Solana made that possible with the least friction. The mint authority has been revoked. The freeze authority has been revoked. The contract — **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc** — is readable by anyone on-chain right now. That is the foundation: a community token whose rules are enforced by math, not by promises.

Solana was chosen for the coin specifically because of what it offers at the point of entry. Transactions confirm in under a second. Fees are measured in fractions of a cent. Wallets are widely available, documented to death, and familiar to a broad audience. None of that is accidental — high fees and slow confirmations are where community momentum goes to die, and TrustTails needed a launch surface that would not punish early holders just for participating.



Why Solana for the $TAIL coin today — four practical reasons, no ideology

The Coin and the Network Are Not the Same Thing

This distinction matters and deserves to be stated plainly. The $TAIL coin on Solana and TAIL Network are two separate, independent things. The coin is a community entry point — a way to participate in what is being built before the full network exists. TAIL Network is a sovereign Layer-1 blockchain being developed on the Cosmos SDK, designed from the ground up with a different architecture and purpose. It is in development. There is no mainnet yet, no live validators, no chain-id to share today.

The intended path — and it is an intention, not a guarantee with a date attached — is that as TAIL Network matures, a bridge will allow community members who hold $TAIL on Solana to migrate to the native network token. The community builds on Solana while the infrastructure is being assembled in parallel. This is not an unusual approach: launching a community-accessible token on an established chain, then migrating to a sovereign chain, has precedent in serious projects. It is also simply honest about where things stand.

> *Choosing Solana was not a statement about which chain is best. It was a pragmatic decision: the lowest friction path for a community to gather, verify, and begin — while the harder work of building something sovereign continues in the background.*

$TAIL Coin — Live Today

SPL token on Solana. Fixed supply. Both authorities revoked. Verifiable on-chain at contract 4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc. Community entry point; pre-launch trading.

TAIL Network — In Development

Sovereign Layer-1 on Cosmos SDK. Independent architecture. No live mainnet yet. The intended destination once the network is built — bridge planned, no date committed.

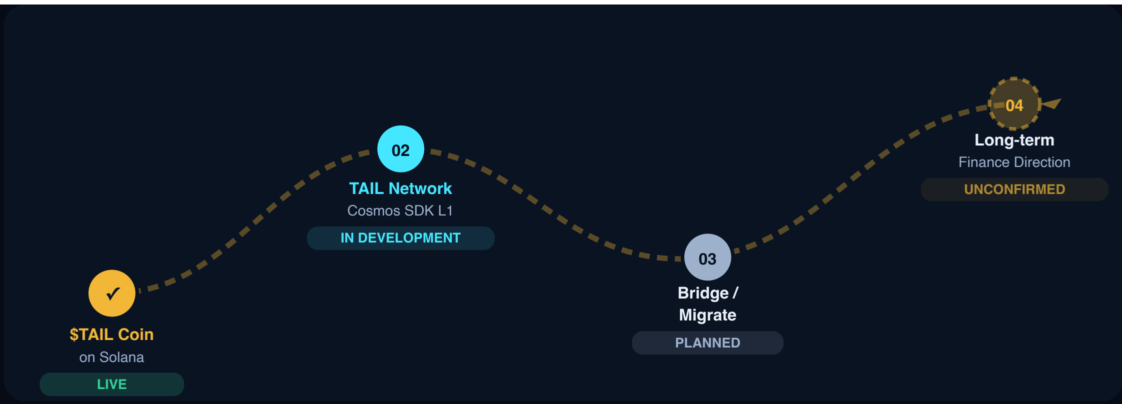
SECTION 07 · ROADMAP

The Journey: An Honest Roadmap

This is not a roadmap of promises. It is a map of intentions — written to be held accountable, not to be forgotten.

TrustTails was honest about what it was from the beginning: a meme coin, built to get noticed. That candour is the foundation everything else must be built on. The roadmap reflects the same principle — each phase is clearly labeled for what it actually is today: live, in development, planned, or unconfirmed. No dates are manufactured. No milestones are declared complete before they are.

The arc is simple. The community begins here, on Solana, around a token that already exists and is already verifiable. From that foundation, a separate, independent blockchain — TAIL Network — is being constructed on the Cosmos SDK. If that network matures, the intention is to give the community a path to migrate. What happens after that is genuinely unknown, and this document says so plainly.



The TrustTails journey — four phases, each labeled with its actual status today.

Phase 01 · $TAIL on Solana LIVE

The $TAIL SPL token exists on Solana right now. Fixed supply of one billion. Mint authority revoked. Freeze authority revoked. Contract address verifiable on-chain. This is the community entry point — the only thing TrustTails is asking anyone to verify today, because it is the only thing that can be verified today.

Phase 02 · TAIL Network IN DEVELOPMENT

A separate, sovereign Layer-1 blockchain being built on the Cosmos SDK. It is independent of Solana. It has its own architecture, its own validator model, its own token economy — none of which are final. No mainnet is live. No chain-id, no explorer, no launch date is being stated here, because none have been confirmed.

Phase 03 · Bridge / Migrate PLANNED

When TAIL Network reaches a state of genuine readiness, the intention is to provide the $TAIL community a path to participate — whether through a bridge, a migration mechanism, or another structure determined by what is technically and legally sound at that time. The mechanism is not yet designed.

Phase 04 · Long-term Direction UNCONFIRMED

There is a long-term belief that blockchain infrastructure can serve financial markets in meaningful ways. That belief drives the architecture choices being made now. But no partnerships exist, no financial institution has been approached, and no regulatory pathway has been secured. This is a direction, not a destination.

> *Honest roadmaps are rarer than they should be. TrustTails has chosen to write one — not because it makes fundraising easier, but because a community built on false milestones is not a community worth building. Every phase above will be updated when its status changes. Not before.*

SECTION 08 · PHASE 1

Phase 1 — Community on Solana (Live Now)

Before a network can be earned, a community has to be built. Phase 1 is that foundation — a live, verifiable Solana token that anyone can hold today, with no gates, no minimums, and no ambiguity about what it is.

The $TAIL coin was deployed on Solana for a simple reason: it is the fastest, cheapest, and most accessible way to put something real in the hands of real people. Solana's throughput and sub-cent transaction fees mean that a holder anywhere in the world can acquire $TAIL without needing to navigate expensive bridging or exchange complexity. The decision was practical, not ideological — the priority was removing every barrier between the idea and its earliest supporters.

Phase 1 is honest about its own scope. The Solana coin is a community entry point, not a finished product. It is the starting line. The harder work — building TAIL Network — has not happened yet and is not claimed to have happened. What Phase 1 offers is something narrower and more verifiable: a token whose supply is fixed, whose mint authority is revoked, and whose freeze authority is revoked. There is no team wallet that can dilute holders. There is no mechanism to freeze accounts. The on-chain record is permanent and public.

> *Contract: **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc** — verifiable on Solscan or any Solana explorer. Mint authority: **REVOKED**. Freeze authority: **REVOKED**. Supply is fixed. No new tokens can be created. No account can be frozen.*

1,000,000,000

FIXED TOTAL SUPPLY — PERMANENTLY

REVOKED

MINT & FREEZE AUTHORITY — ON-CHAIN

What Exists Today

- The $TAIL SPL token, live on Solana mainnet with verifiable on-chain parameters
- Mint authority revoked — the supply of 1,000,000,000 $TAIL is permanently fixed
- Freeze authority revoked — no entity can freeze any holder's wallet
- The TrustTails website, introducing the project and its intent without overpromising
- Active community channels on X (Twitter) and Telegram, where the conversation is open and ongoing
- This whitepaper — a transparent account of what is built, what is being built, and what remains unproven

What Phase 1 Is Not

Trading is pre-launch. TAIL Network does not exist yet. There are no confirmed exchange listings, no institutional partnerships, and no staking or utility mechanisms active at this stage. Phase 1 makes no return promises and sets no price targets. The community that gathers here is gathering around an idea and a commitment — not a finished system.

That honesty is deliberate. The thesis of this project is that trust is built by being accurate about limitations as much as potential. Anyone who holds $TAIL in Phase 1 does so knowing exactly where the project stands. That shared clarity is the foundation that everything after has to be built on.

> *"Started as a meme to get noticed — everything after has to be earned, not claimed." Phase 1 is the notice. Everything that follows depends on what the community and the team are willing to build together, transparently, over time.*

SECTION 09 · PHASE 2

TAIL Network — An Independent Cosmos SDK Chain

The Solana token is the starting point, not the destination. Phase 2 is the construction of something larger: a sovereign, application-specific Layer-1 blockchain built on the Cosmos SDK — designed for the community that $TAIL is building.

TAIL Network is a separate, independent blockchain — entirely distinct from Solana. It is not a smart contract deployed on an existing chain. It is not a wrapped asset. It is a new sovereign chain, responsible for its own consensus, governance, and economics. That distinction matters, and it is why Phase 2 requires time to build correctly.

Why the Cosmos SDK

The Cosmos SDK is a battle-tested open-source framework for building application-specific, sovereign blockchains. Chains built with it — including Cosmos Hub, Osmosis, Celestia, and dozens of others — operate independently while remaining interoperable through the Inter-Blockchain Communication protocol (IBC). IBC allows assets and data to move between chains without relying on centralized bridges, a meaningful architectural advantage over many competing approaches.

Choosing the Cosmos SDK is a choice for sovereignty. TAIL Network would control its own validator set, its own upgrade path, its own fee structure, and its own governance mechanisms. No dependency on another chain's roadmap. No permission required from a third-party foundation to evolve the protocol.

Sovereignty

Full control over consensus rules, governance, and protocol upgrades — not subject to another chain's decisions or congestion.

IBC Interoperability

The Cosmos Inter-Blockchain Communication protocol enables trustless asset and message transfers across compatible chains without centralized intermediaries.

Application-Specific Design

Unlike general-purpose chains, app-specific chains can be tuned for efficiency, throughput, and the precise features a community actually needs.

Optional Compliance Features

An independent chain creates the architectural possibility — not the commitment — to implement optional compliance tooling if the community and market require it.

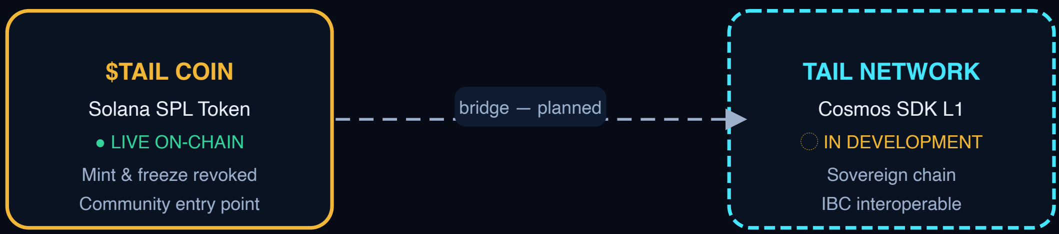
Status: In Development

TAIL Network does not have a live mainnet. There is no chain-id to look up, no block explorer to visit, no validator set running today. What exists is the intention, the framework choice, and the work of building toward it. Goals — efficiency, reliability, community governance, and optionally, compliance-adjacent features — are stated intentions. They are not committed deliverables with guaranteed timelines. The honest framing is this: it is being built, and it will be earned through execution, not announced into existence.

> *No chain-id, no validator set, no mainnet launch date has been announced. TAIL Network is in active development. All described capabilities are goals, not guarantees. Progress will be demonstrated on-chain as it is achieved.*

The Bridge — A Planned Path

The intended journey is a migration: the community that forms around the Solana $TAIL coin becomes the foundation that inhabits TAIL Network as it matures. A bridge mechanism — allowing $TAIL holders to move from Solana to the native TAIL Network token — is part of the plan. The mechanics, timing, and economics of that bridge have not been finalized and will not be invented here.



The intended migration path: $TAIL holders on Solana (live) bridge to TAIL Network (Cosmos SDK Layer-1, in development). Bridge mechanics and timing are not yet finalized.

SECTION 10 · PHASE 3

Bridge, Migrate & the Long-Term North Star

The Solana $TAIL coin is the beginning of the story, not the end of it. The long-term intention is for that community — every holder, every participant — to migrate onto a sovereign chain built for them.

TAIL Network is being built on the Cosmos SDK as an independent, sovereign Layer-1 blockchain. It is in active development. There is no mainnet live, no confirmed launch date, and no chain tokenomics to announce yet. What exists today is the vision, the architecture decision, and the community forming around it.

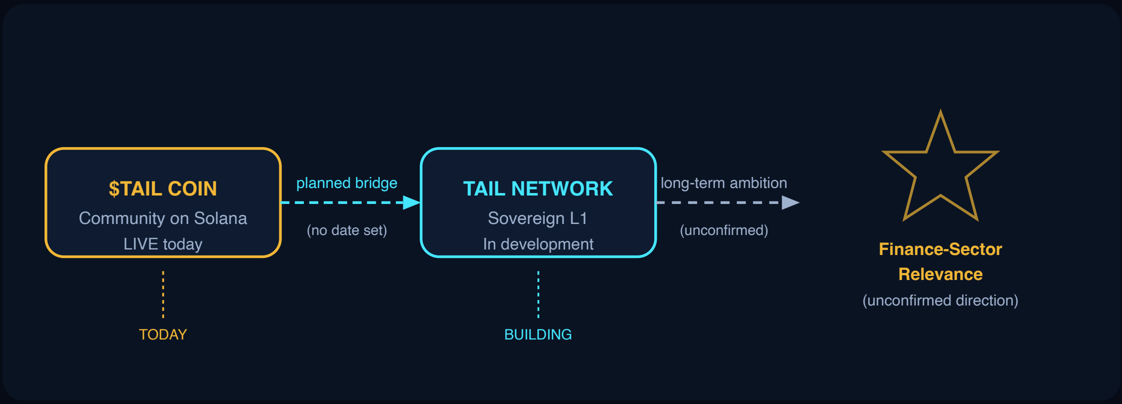
When TAIL Network reaches a state of genuine readiness, the plan is to provide a bridge or migration path so that holders of the Solana $TAIL coin can move to the native TAIL Network token. The mechanics of that bridge — whether it is a one-way burn-and-mint, a custodial swap, or a multi-step migration — will be designed and disclosed publicly well before it opens. Nothing will happen automatically or without community visibility.

> *The bridge is an intention, not a promise. No date is set. No migration will open until TAIL Network is live, audited, and the team considers the risk acceptable for the community holding real assets.*

The North Star: Finance-Sector Relevance

Beyond the bridge, the team holds an unconfirmed long-term directional ambition: that TAIL Network could one day serve as infrastructure for payments, remittances, or settlement use cases where speed, low cost, and finality matter. This is stated as ambition, not a product roadmap.

To be direct: TrustTails has no current partnerships, affiliations, or signed agreements with any financial institution, payment processor, or regulated entity. Any future claim of finance-sector relevance will only be made after a signed, publicly verifiable agreement exists. Until that moment, this direction is a north star — something the team is building toward, not something that has arrived.



The intended arc: $TAIL community on Solana → planned bridge to TAIL Network (in development) → long-term unconfirmed directional ambition toward finance-sector relevance. No partnerships or dates implied.

What is confirmed

- $TAIL coin is live on Solana, mint authority revoked, supply fixed
- TAIL Network is being built on Cosmos SDK
- A bridge/migration is the stated long-term intention

What is not confirmed

- No mainnet date for TAIL Network
- No bridge mechanics or timeline published
- No institutional partnerships or finance-sector agreements

The thesis that began this project — started as a meme to get noticed, everything after has to be earned — applies here most of all. A north star is only worth pointing at if the team is willing to say, clearly, how far away it is.

SECTION 11 · THESIS

The Throughline

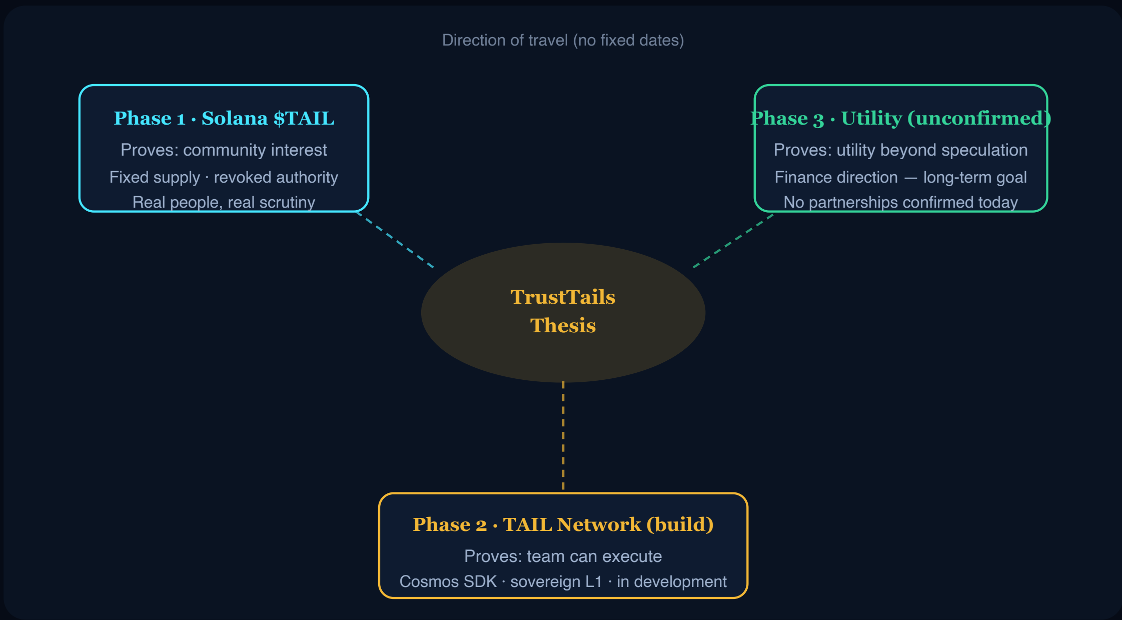
The honest version: this started as a meme to get noticed. Everything after has to be earned, not claimed.

There is a single thread running through every decision in TrustTails — from a fixed-supply Solana token with revoked authorities to an in-development sovereign chain built on Cosmos SDK. That thread is simple:

infrastructure that is efficient enough to hold a meme community together is the same infrastructure, in kind if not yet in scale, that financial workloads demand. Provable scarcity. Immutable rules. Transparent state. No single operator with a secret off switch.

This is not a guarantee that TrustTails will reach finance. It is an observation that the properties required to earn community trust and the properties required to earn institutional trust are directionally the same. The meme phase is not a throwaway prelude — it is the first proof of concept, run in public, with real money and real people scrutinising every on-chain decision.

Three Phases, Three Things to Prove



The TrustTails throughline: three phases, each with a distinct claim to prove before the next begins.

Phase 1 is already verifiable. The $TAIL token exists on Solana. Mint authority is revoked. Freeze authority is revoked. Supply is fixed at one billion. Anyone can check contract *4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc* right now. What Phase 1 proves — or fails to prove — is whether there is genuine community interest in the ideas behind TrustTails, not just in token price. Community growth without hype is the only honest signal worth collecting at this stage.

Phase 2 is the harder test. Building a sovereign chain on Cosmos SDK is real engineering work. TAIL Network is in development; there is no mainnet, no confirmed launch date, no invented validator set. What Phase 2 must prove is simply that the team can execute — ship code, pass security review, build something that works. That proof cannot be borrowed in advance.

Phase 3 is a direction, not a destination that has been reached. The hypothesis is that a chain built with verifiable finality and transparent ownership rules is worth exploring as infrastructure for financial applications. That hypothesis remains unconfirmed. No finance partnerships exist today. No institutional commitments have been made. The honest position is that phase 3 only becomes available to pursue if phases 1 and 2 deliver on their own terms first.

> *The throughline is not a pitch — it is a logic chain. Efficient enough for a meme community today might be efficient enough for finance workloads tomorrow. But "might" is the operative word. Every claim in this document is bounded by what exists, what is in progress, and what is only intended.*

SECTION 12 · TRANSPARENCY

How We Communicate

The only thing harder than building something real is getting people to believe you are building it. We have chosen to make that easier by saying less, not more.

Most projects in this space communicate ambition as if it were accomplishment. Roadmaps read like press releases. Partnerships get announced before agreements are signed. Token metrics get framed to imply returns. We have watched enough cycles to know where that ends. Trust, once spent on inflated claims, does not come back.

TrustTails operates on a different set of rules — not because we are more virtuous, but because we believe honest communication is the only kind that compounds over time.

Our Commitments

Intentions, not promises

When we describe the future — the TAIL Network, the bridge from Solana, the long-term finance-sector direction — we use the language of intention. "We are building toward" is not weakness; it is accuracy. Nothing is promised until it is delivered.

No price or return language

We will never publish price targets, return projections, or anything that implies $TAIL will increase in value. Markets are not ours to predict. Anyone who claims otherwise is selling something we are not.

Partnerships are announced after they exist

Finance-sector relevance is a long-term, unconfirmed direction. We have no signed agreements today. When we do, we will publish them. Until then, we will not hint, tease, or imply relationships that have not been formalised.

Corrections are made openly

When we get something wrong — a technical estimate, a timeline, a description of how something works — we say so publicly and correct the record. Silence on mistakes is its own form of deception.

> *The thesis of this project is blunt: started as a meme to get noticed — everything after has to be earned, not claimed. That applies to how we communicate just as much as to what we build. A community that trusts us because we were honest when honesty was inconvenient is worth more than one that followed us because the numbers looked exciting.*

Why This Matters for Longevity

Short-term community growth is easy to manufacture. Sustained trust is not. The projects that survive multiple market cycles are almost always the ones whose communities knew exactly what they were getting — and found out the team told the truth even when the news was slow or difficult.

We are in the early stages of something that, if it works, will take years to build properly. The TAIL Network is in development. The Solana $TAIL token is the community's entry point today — verifiable on-chain, no surprises in the contract. Everything else is work in progress, and we will report on that progress honestly, at the pace reality allows.

- Progress updates will distinguish clearly between what is live, what is in development, and what is aspirational.
- Community questions will receive direct answers, including "we do not know yet."
- This whitepaper will be versioned. Changes will be logged and explained.

We are not asking anyone to trust us based on claims. We are asking people to watch what we do, hold us to what we have written here, and judge accordingly.

SECTION 13 · COMMUNITY

Community & Participation

TrustTails began as a meme. What kept it going was people — and what keeps it honest is the same thing.

No venture backing launched $TAIL. No influencer deal seeded the first holders. The project came to life through shared curiosity, a genuine dislike of the noise that dominates crypto, and a simple on-chain fact: a coin with its mint and freeze authorities revoked, owned by whoever chooses to hold it. That structure was always designed to make the community the only authority that matters.

That is still true today. The work ahead — building TAIL Network on the Cosmos SDK, designing a governance model worth trusting, proving relevance in whatever industries choose to engage with us — cannot be done by a small team alone. It requires a community willing to participate honestly, hold the project accountable, and grow it without manufactured hype.

Official Channels

All genuine TrustTails communication happens through a small number of verified channels. If something is not listed here, it is not official — and you should treat it with scepticism regardless of how credible it looks.

- Website: **trusttails.com** — documentation, whitepaper, and on-chain verification links
- Twitter / X: **@TrustTails** — announcements and community conversation
- Telegram: the link pinned on the official website — the only official group chat
- Contract (verifiable now): **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc** on Solana

> ***Pre-launch notice:*** *$TAIL is not yet trading on any exchange. There is no presale. No one from TrustTails will ever DM you first, offer you an early allocation, or ask you to send tokens anywhere. If you encounter any of that, it is a scam — report it and move on.*

How to Take Part

Participation right now is straightforward: follow the official channels, verify what you read against what is actually on-chain, and contribute to conversation that is grounded rather than speculative. When trading opens, the only legitimate place to acquire $TAIL will be through the public market — no whitelists, no private rounds.

As TAIL Network development progresses, there will be meaningful ways to contribute: governance input, validator participation, tooling, and community-led initiatives. None of those roles have been finalised — and we would rather describe them when they are real than promise them now to build excitement.

The Ethic We Hold

No paid shills

We do not pay for promotion. Anyone who claims to be a TrustTails ambassador or paid representative is not acting on our behalf.

Verify on-chain

Every claim we make about the $TAIL token — supply, revoked authorities, contract address — is verifiable on Solana right now. Trust the chain, not the deck.

Official channels only

Scams multiply around pre-launch projects. If a channel, wallet, or person is not linked from trusttails.com, assume it is not us.

Honest pace

We will not announce milestones before they are reached or partnerships before they are signed. Slower and true beats fast and hollow.

This ethic is not marketing copy. It is the only way a project that started as a meme earns the right to become something more. The community is not an audience — it is the institution. And institutions are built on what people actually do, not what they promise.

SECTION 14 · RISK

Risk, Compliance & Disclaimer

This document does not constitute financial advice, legal advice, or an offer to purchase any security or regulated financial instrument. Read everything in this section before going further.

> ***Nothing in this whitepaper is a promise of profit, return, or appreciation.*** *TrustTails is an early-stage project with real technical, regulatory, and market risks. Participation could result in the total loss of any funds involved. Please consult a licensed financial adviser, legal counsel, and tax professional before making any decision.*

What Is Live — and What Is Not

The $TAIL SPL token is live on the Solana blockchain. Its mint authority and freeze authority are both permanently revoked and verifiable on-chain at contract address **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc**. Fixed supply is 1,000,000,000 tokens. That is verifiable today. Token trading is pre-launch.

The TAIL Network — a sovereign Layer-1 blockchain being developed on the Cosmos SDK — is **in development and does not yet exist as a live mainnet**. No chain-id, no explorer, no validator set, no launch date has been announced. Any description of the TAIL Network in this document reflects intention and architectural direction only. Nothing about it should be read as confirmed.

The planned bridge or migration path between the Solana $TAIL community token and a future TAIL Network is an **intention, not a commitment**. Technical feasibility, regulatory landscape, and community conditions will all shape whether and how that path is executed.

Key Risk Factors

- **Total loss of capital.** Cryptocurrency and token markets are highly volatile. There is no floor, no guarantee, and no recourse mechanism.
- **Regulatory uncertainty.** Crypto-asset regulations differ across jurisdictions and continue to evolve rapidly. Holding or trading $TAIL may be restricted or prohibited where you reside. It is your responsibility to determine the legal status in your jurisdiction.
- **Development risk.** The TAIL Network may take longer than anticipated, change in scope, or may not be completed. Roadmap milestones are targets, not contractual obligations.
- **Technology risk.** Smart contracts, cross-chain bridges, and Layer-1 blockchains all carry the possibility of bugs, exploits, or unexpected failures — including those beyond the team's control.
- **Liquidity risk.** Pre-launch tokens may have limited or no liquid markets. You may be unable to exit a position at a price you consider fair, or at all.
- **No affiliations or partnerships.** Any reference to industries, use-cases, or sectors in this whitepaper reflects long-term, unconfirmed direction only. TrustTails has no announced partnerships, institutional affiliations, or formal integrations as of the date of this document.
- **Team and execution risk.** Early-stage projects rely heavily on a small core team. Changes in personnel, resources, or focus can materially affect outcomes.

No Investment Relationship

Holding $TAIL does not confer equity, dividends, governance rights over a registered entity, or any claim against TrustTails or its contributors. This whitepaper is informational only and has not been reviewed or approved by any financial regulatory authority.

We started with honesty as the core principle — not because it is easy, but because the alternative is what destroyed trust in this space before us. Hold us to every word written here. If something changes, we will say so. Trust is earned in small steps, over time, by showing up exactly as we said we would.
