

TrustTails Whitepaper

Trust, earned — not claimed. A community-first token on Solana
with a fixed supply, revoked authorities, and a refusal to
oversell.

VERSION 1.0 · \$TAIL · BUILT ON SOLANA

SECTION 01 • ORIGIN

More Than a Meme

The most consequential financial tools in history arrived looking unserious. The ones that lasted were earned, not announced.

In January 2009, a nine-page PDF circulated among a small mailing list of cryptographers. Most dismissed it. The ones who read it carefully noticed something different: a quietly radical idea, stated with no drama, no marketing, no promise of returns. Fifteen years later, that PDF had restructured how a generation thinks about money. Bitcoin did not begin credible. It became credible — through time, through use, through communities of people who kept building when no one was watching.

In 2013, two software engineers created Dogecoin as a joke. The Shiba Inu, the Comic Sans font, the whole thing was a parody. And yet something unexpected happened: people showed up. They tipped each other. They funded a Jamaican bobsled team and a NASCAR driver. They built a community around the joke — and in doing so, they demonstrated something the original creators hadn't planned for: that the entry point doesn't determine the ceiling. The meme was the door. What came after was something else.

TrustTails begins honestly: it started as a meme. That is not a weakness to apologize for. It is context. Memes travel. Memes reach people who would never open a financial prospectus. Memes lower the barrier enough that someone who has never held a token can find themselves in a conversation that changes their relationship with money. TrustTails uses that reach deliberately — as an entry point, and only as an entry point.

The name says everything about the intention. Not "MoonTails." Not "RichTails." TrustTails. Trust is not a feature you ship — it is something you accumulate, slowly, by doing what you said you would do, repeatedly, over time. That is the only roadmap this project is willing to commit to.

Everything that follows in this document — the tokenomics, the design choices, the long-term direction — is built around one operating principle: *started as a meme to get noticed; everything after has to be earned, not claimed*. No partnerships have been announced that do not exist. No financial returns are projected. No allocation percentages are invented for the appearance of structure. What exists, exists. What is being built, is being built. Nothing more is promised here.

Direction of intent — not a guarantee of outcome

The entry point is a meme. What follows must be earned through each stage — community cohesion, accumulated trust, and eventually, genuine utility. This diagram shows direction of intent, not a promise of timeline or outcome.

The diagram above is not a roadmap with delivery dates. It is a statement of direction and priority. We are at the beginning of that line. The community is forming. Trust has not been earned yet — and that is the most honest thing this document can say. It is also, perhaps, the most important.

SECTION 02 · THE NAME

Trust + Tails: What We Stand For

The name is a wager on honesty — a public commitment that this project lives or dies on whether it earns what it is called.

Most crypto projects announce trust. They put it in the whitepaper, stamp it on the landing page, and repeat it until the word loses all meaning. TrustTails takes the opposite position: trust is not a feature you ship, it is a verdict other people deliver about you — slowly, on the basis of what you actually do.

Why "Tails"

The animal-coin tradition exists for a reason. Playfulness is disarming. It lowers the barrier to entry, invites a broader audience, and signals that the team is not taking itself so seriously that it has forgotten who crypto was originally for — curious people, outsiders, early adopters who find something interesting and decide to follow along. "Tails" fits that lineage honestly: it is the flip-side of the coin, the underdog, the part of the story that comes after the initial noise has settled.

The name also carries a deliberate tension. "Trust" is a serious, sober word. "Tails" is light, even a little cheeky. That friction is intentional. We are not a stiff institutional product, and we are not a pure meme with nothing underneath. TrustTails is the attempt to inhabit the space between the two — rigorous where it matters, human everywhere else.

The Founding Principle

"Started as a meme to get noticed — everything after has to be earned, not claimed."

That sentence is the project's internal constitution. Getting noticed is not a sin in a crowded market; it is a practical necessity. But attention without substance is a short trade. TrustTails is built on the view that the right way to use early attention is to immediately begin doing things that justify it — transparent mechanics, honest communication, and a community that is treated as a partner rather than a number to report.

Undersell and Overdeliver

Where most token projects over-promise on roadmaps, partnerships, and financial outcomes, TrustTails operates on a single operating principle: say less than you could, then do more than you said. This means resisting the urge to announce ambitions before they are real. It means flagging uncertainty explicitly — including in this document — rather than papering over it with confident language. And it means that when a milestone is reached, it speaks for itself without needing embellishment.

No price targets appear in this whitepaper. No return projections. No confirmed partnerships. What appears instead is a clear account of what exists today, what is being built toward, and what remains

genuinely uncertain. Readers are owed that honesty. Over time, actions either justify the name or they do not. That accountability is the whole point.

What "Trust" demands

Consistent behaviour over time. Transparency when things are uncertain. No promises made ahead of the work that earns them.

What "Tails" permits

Warmth, wit, and accessibility. A community that does not take itself too seriously — but takes its commitments seriously.

SECTION 03 • THE TOKEN

TAIL at a Glance

Before ambition, there are facts. Here is what TAIL is — on-chain, verifiable, and fixed.

TrustTails (TAIL) is a standard SPL token deployed on the Solana blockchain. SPL is Solana's native token program — the same infrastructure used by every fungible token on the network. There is nothing exotic in the contract itself. What matters are the specific choices made at deployment, and what those choices remove from the table permanently.

CHAIN	FIXED SUPPLY	MINT AUTHORITY	FREEZE AUTHORITY
Solana	1,000,000,000		
SPL Token	1 Billion TAIL No more can ever be created	REVOKED New tokens cannot be minted	REVOKED Wallets cannot be frozen
4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc			

TAIL token parameters — all verifiable on-chain via Solana Explorer or Solscan.

What Revocation Actually Means

Two authorities are permanently removed at the contract level. The first is mint authority: no wallet — including the team's — can ever create additional TAIL tokens. The supply ceiling of one billion is a hard, on-chain fact, not a promise in a document that can be rewritten. The second is freeze authority: no party can lock or restrict a holder's wallet. These are not settings that can be toggled back on. Revocation is irreversible.

For a holder, the practical effect is straightforward. The number of tokens that will ever exist is the number that exist today. Your tokens cannot be taken from you by the issuer. The team retains no administrative lever over the supply or over individual wallets. What happens to the value of TAIL from here is a question the market answers — not the founding team, not a multisig.

*The contract address **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc** is public. Every parameter described on this page — supply, mint status, freeze status — is readable by anyone with a browser and a Solana block explorer. We encourage verification before any decision.*

Why Solana?

Fixed Supply, Real Scarcity

Solana offers sub-second finality and transaction fees measured in fractions of a cent. For a community token that needs to move freely between many hands, the cost of participation matters. A token that costs dollars to transfer is, in practice, illiquid for small holders.

One billion tokens. No inflation mechanism, no team reserve mint, no vesting contract that can quietly issue new supply. The ceiling was set at launch and enforced by revoking the only key that could raise it.

These are the foundations. They do not guarantee any outcome — they remove specific categories of risk that have historically harmed token holders in other projects. What is built on top of these foundations is the harder and more interesting question, which the rest of this document addresses honestly.

SECTION 04 • TOKENOMICS

Tokenomics: Fixed by the Chain, Not a Promise

Most token projects ask you to trust their promises. TrustTails asks you to trust the chain.

The supply of TAIL is fixed at exactly one billion tokens. That number cannot increase. Not through a governance vote, not through a team decision, not through a smart-contract upgrade. The mint authority — the on-chain permission that would allow new tokens to be created — has been permanently revoked. The transaction is public, verifiable, and irreversible. There is no mechanism left in existence that can produce a single additional TAIL token.

This is not a policy. It is not a roadmap commitment. It is a cryptographic fact.

Why This Matters

Inflationary tokens are common in the crypto space. Teams retain mint authority to fund future development, reward validators, or expand community incentives over time. There is nothing inherently dishonest about that model — but it places an ongoing supply risk on every holder. Every new token minted dilutes the share held by everyone else. Whether that dilution is disclosed or not, whether it feels fair or not, the economic effect is the same.

TrustTails made a different choice at the outset. By revoking mint authority before any significant distribution, the project removed that risk permanently — and removed its own ability to reverse the decision. The freeze authority has also been revoked, meaning no central party can freeze token accounts. Holders' wallets cannot be locked by the project team.

*Mint authority: REVOKED. Freeze authority: REVOKED. These are on-chain states, not promises in a document. Anyone can verify them at any time against the contract address **4NoNV3jSYLRbUtVWSTK5XdKpuvRzGpMCmfZSBKMuk6Rc** on Solana.*

What We Are Not Claiming

TrustTails does not publish a treasury allocation breakdown, a team vesting schedule, or a community reserve percentage — because there is no such structure to publish honestly. The supply is fixed. How it has been and will be distributed is a matter of ongoing community reality, not pre-assigned buckets that can be presented as reassurance. We will not invent an allocation chart to fill space in a whitepaper.

What we can say clearly: no new supply will appear. That single property is the foundation on which everything else about this project has to be built — through community trust earned over time, not through tokenomics architecture designed to look sophisticated on paper.

1,000,000,000

vs

0

New tokens that can ever be minted
Mint authority revoked — on-chain, permanent

Contract: 4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc · Solana

TAIL has a fixed total supply of 1,000,000,000 tokens. No allocation split is shown because none exists by design — the mint authority is permanently revoked, making new issuance cryptographically impossible.

A fixed supply does not guarantee value. It removes one specific and significant source of dilution risk — and it does so in a way that cannot be walked back. In a space where promises are common and reversals are frequent, that permanence is worth understanding clearly.

SECTION 05 • TRUST MODEL

The Trust Model: Revoked Authorities

Two on-chain actions — irreversible, public, permanent — form the technical core of everything TrustTails asks you to believe.

Most token projects rely on promises. Promises about future burns, promises about team integrity, promises that no one will abuse the levers they quietly kept hold of. TrustTails took a different approach: remove the levers. What follows is an honest explanation of what that means, what it eliminates, and what it does not.

Mint Authority: The Power to Inflate

On Solana's SPL token standard, mint authority is the cryptographic permission to create new tokens. When active, whichever wallet holds that key can expand the total supply at any time, without a vote, without community consent, and without warning. For holders, this is an invisible but structural risk: the tokens they hold can be diluted the moment someone decides it is convenient. Projects have historically used this to fund operations, pay team members quietly, or simply exit. The risk is not theoretical — it has played out repeatedly across the ecosystem.

TrustTails revoked mint authority at launch. The transaction is recorded on-chain, verifiable by anyone with a block explorer and a contract address. No wallet — including the founding team's — can ever mint an additional TAIL token. The supply ceiling of 1,000,000,000 is not a policy; it is a protocol fact.

Freeze Authority: The Power to Immobilise

Freeze authority is less discussed but equally consequential. When active, it allows the authority holder to freeze any token account — rendering a holder unable to transfer, sell, or use their tokens. The practical implication is stark: someone could be locked out of their own balance, selectively and silently. This capability has been used in scams to trap liquidity before a coordinated exit.

TrustTails revoked freeze authority at launch. No account holding TAIL can be frozen by any party. Once you hold TAIL, your ability to move it is yours alone.

Both authorities revoked at launch — on-chain, irreversible. Verifiable at contract
4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc.

What Revocation Actually Means

Revocation on Solana is not a setting that can be toggled back on. It is a one-way state transition at the protocol level. Once an authority is revoked, even the original deploying wallet has no path to reclaim it. There is no admin key, no multisig override, no future governance vote that can restore it. The Solana runtime enforces this unconditionally.

Revoked authorities do not require you to trust the team's intentions. They remove the need for that trust entirely. The guarantee is cryptographic, not reputational.

What revocation eliminates

- Stealth supply inflation by any party
- Selective freezing of holder accounts
- Coordinated exit via dilution or lockout
- Any future team control over tokenomics

What revocation does not change

- Market price — entirely determined by open trading
- Liquidity risk — pools remain independent
- Adoption — still unproven and early-stage
- Regulatory status — no position is claimed here

These two revocations are the structural argument at the heart of TrustTails. They do not make TAIL a good investment. They do not guarantee any outcome. What they do is remove a specific, common, and historically consequential category of risk — and they do so in a way that no amount of continued promises or updated whitepapers could replicate. The chain has already spoken. The rest is up to the community to build.

SECTION 06 • WHY SOLANA

Why We Built on Solana

The choice of blockchain is a product decision, not a loyalty pledge. We chose Solana because it makes TrustTails usable — and because the properties that make it usable today are the same ones that could matter for more serious applications later.

When we revoked the mint and freeze authorities and embedded TAIL's contract on-chain, we needed a network that could carry that signal cheaply and quickly to anyone who wanted to verify it. A token built around trust cannot live on infrastructure that charges several dollars to move, or takes minutes to confirm a transaction. Those conditions quietly discourage the everyday participation that community-first tokens depend on.

Solana's average transaction fee sits below a fraction of a cent, and block finality is typically achieved in under a second. Those are not marketing claims — they are published network metrics visible to anyone running a node or reading the Solana explorer. For a holder checking that their wallet received TAIL, or a newcomer verifying the revoked authorities on-chain for the first time, that speed and cost structure removes friction that would otherwise erode trust before it has a chance to form.

 Speed ~400ms block finality on average	 Low Fees Fractions of a cent per transaction	 Scalability Thousands of TPS without congestion	 Ecosystem Wallets, DEXs, and tooling already mature
---	---	--	--

Solana's core properties as they apply to TrustTails: verified network characteristics, not projections.

The ecosystem dimension also matters practically. Solana has a deep set of tools that already exist — wallets like Phantom and Solflare, decentralised exchanges, explorers, and SPL token standards — which means holders do not need to become technical specialists to interact with TAIL. That accessibility is not incidental to the project's values; it is central to them.

We are not making a claim that Solana is the only chain capable of supporting what TrustTails might become. We are saying it was the most honest choice for where TrustTails is right now — a community token that needs to be cheap, fast, and easy to verify from day one.

There is also a longer arc worth naming honestly. If TrustTails ever moves toward finance-adjacent utility — and that ambition exists, even if no partnerships or products are confirmed — the same network properties that make it a good home for a community token are the same ones that matter for transaction-intensive applications. Settlement speed and fee predictability are not meme-tier

requirements. They are baseline infrastructure requirements for anything handling real value at scale. Solana satisfies both, at least by current published benchmarks.

We chose this chain. We will keep explaining why. And if the reasoning ever stops holding, we will say that too.

SECTION 07 • ROADMAP

The Journey: An Honest Roadmap

This is a roadmap of intentions, not a schedule of promises. We say that plainly because we think you deserve to know the difference.

TrustTails began as a meme — a dog, a tail, a joke that got a little too serious. What happened next was not planned in a boardroom: a community formed, the mint authority was revoked, the freeze authority was revoked, and a fixed supply of one billion tokens was locked in place permanently. Those are facts. Everything beyond that is aspiration, and we intend to treat aspiration with honesty rather than dress it as certainty.

The roadmap below is structured in three phases. Phase 1 is live and verifiable on-chain. Phase 2 describes infrastructure work we are actively exploring. Phase 3 describes a long-term directional ambition — finance-sector relevance — that remains unconfirmed and contingent on things we cannot yet control: regulatory clarity, partnership development, and sustained community growth. We will update this section as facts replace intentions.

TrustTails three-phase journey. Phase statuses reflect reality at time of publication: Phase 1 is live and verifiable on-chain; Phase 2 is under active exploration; Phase 3 is a long-term ambition with no confirmed partnerships or timeline.

Phase 1 — Community · **Live**

The token exists. The authorities are revoked. A community has formed organically. This phase is not a claim — it is an on-chain fact anyone can verify at contract address `4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc`. The work of Phase 1 is simple and ongoing: earn trust, one interaction at a time.

Phase 2 — Infrastructure · **Exploratory**

We are investigating utility mechanisms, broader exchange listings, and on-chain governance tooling. Nothing here is confirmed. We will announce only when something is real, signed, and verifiable — not when it is hoped for.

Phase 3 — finance-sector relevance — is a direction, not a destination we have booked. It depends on regulatory developments, institutional appetite, and partnerships that do not yet exist. We include it because it is where we genuinely want to go. We exclude false certainty because that is not how trust is built.

SECTION 08 · PHASE 1

Phase 1 — Community (Live Now)

Before anything can be built, something real has to exist. Phase 1 is about establishing that foundation honestly — not with promises, but with verifiable facts and a community that chooses to show up.

TrustTails launched as a meme token on Solana. That origin is not something we obscure — it is the starting point. What happens after launch is what defines whether a project earns a longer life or fades with the rest. Phase 1 is entirely focused on the former: doing the unglamorous, foundational work that makes everything else possible.

What Is Already Done

Token Deployed

The TAIL token is live on Solana with a fixed supply of 1,000,000,000. Both mint authority and freeze authority have been permanently revoked, meaning no new tokens can ever be created and no wallet can ever be frozen by the team. The contract is public and independently verifiable.

Website Live

The TrustTails website is live and serves as the primary public reference point — contract address, supply details, social links, and the whitepaper. It is intentionally straightforward. There are no countdown timers, no referral traps, no manufactured urgency.

Community Channels Open

The official X (Twitter) account and Telegram group are active. These are the places where the community gathers, asks questions, shares the project, and holds the team accountable. Both channels are moderated to keep conversation honest and signal-rich.

Whitepaper Published

This document. A whitepaper that says what the project is, what it is not, and what remains genuinely uncertain. Written for people who read carefully, not for people looking for permission to speculate.

What Phase 1 Is Actually About

Community is not a metric in Phase 1 — it is the entire point. A token with no utility yet and no confirmed partnerships has exactly one thing to offer at this stage: transparency. The team's job right now is to show up consistently, answer questions directly, and avoid the temptation to overpromise in order to accelerate growth.

Everyday accessibility matters here. TrustTails is not positioning itself as an insider asset for sophisticated traders. Anyone with a Solana wallet can hold TAIL. The whitepaper is written in plain language. The community channels are open to anyone. There are no tiered access levels, no presale whitelists, no early-backer exclusives that create a two-class holder base.

The honest measure of Phase 1 success is not price action or holder count. It is whether the people who find TrustTails in this period feel they were told the truth — and decide to stay because of that, not despite it.

Growth in Phase 1 is organic and community-driven. There is no paid influencer campaign running. There is no coordinated pump. If TrustTails earns a larger audience, it will be because the community found the project credible and chose to share it. That is the only kind of growth that produces holders who understand what they hold — which is the only kind of holder base worth building on.

4

PHASE 1 FOUNDATIONS COMPLETE: TOKEN, WEBSITE, COMMUNITY CHANNELS, WHITEPAPER

SECTION 09 • PHASE 2

Phase 2 — Independent Infrastructure

An honest exploration, not a promise: if Phase 1 earns the trust and the team earns the capacity, the longer horizon may include infrastructure that belongs to no single chain.

TrustTails launched on Solana because Solana is fast, inexpensive, and well-understood by the community that gathered around the project first. That decision was practical, not ideological. Over time — and only if the team, funding, and demonstrated capability support it — there is an intention to explore what it would mean to operate infrastructure that is not wholly dependent on the health, governance decisions, or fee schedules of any single network.

This is written as an intention deliberately. No timeline is committed. No partner infrastructure provider is engaged. No technical architecture has been finalised. What follows describes the goals that would guide that exploration, not deliverables that are guaranteed to arrive.

What Independent Infrastructure Might Address

Predictable Fees

Reliance on a third-party network means fee volatility is largely outside the project's control. Infrastructure with more direct fee governance could allow the community to plan interactions with genuine cost predictability.

Reliability

Public networks experience congestion and, occasionally, outages. Independent or partially independent infrastructure would allow the team to make different availability commitments — though this comes with proportionally higher operational responsibility.

Optional Compliance Tooling

Regulated contexts — including any serious engagement with financial services — typically require the ability to implement specific compliance controls. Infrastructure the project controls could offer these as opt-in features rather than as network-level constraints.

Community Governance of Upgrades

When protocol changes are decided externally, token communities absorb them without a vote. Owning more of the stack shifts that balance, giving holders a meaningful voice on protocol decisions that affect them.

Possible goals if independent infrastructure exploration proceeds — each branch is conditional on team capacity, funding, and community readiness. None is a committed deliverable.

The willingness to write "we do not know yet" is itself part of the thesis. Projects that commit to infrastructure roadmaps before they have the team to build them are making promises their community will eventually have to forgive. TrustTails would rather earn the right to build this than announce it prematurely.

Preconditions for Exploration to Become Development

The team has identified three honest preconditions before Phase 2 moves from exploration to active development. First, Phase 1 must demonstrate that the community is real and engaged — not merely speculative. Second, sustainable funding must exist that does not require the project to make commitments it cannot keep to attract it. Third, the core team must have the technical capacity to take on infrastructure responsibility without hollowing out the quality of everything already built.

If those three conditions are not met, Phase 2 stays exploratory indefinitely. That is not failure — it is the project behaving the way it said it would.

SECTION 10 • PHASE 3

The Finance Sector as a North Star

A direction, not a destination. A question the community is choosing to ask — not an outcome that has been secured.

Every project that has lasted in this space eventually had to answer a harder question than "how do we grow the community?" TrustTails is no different. The question we are sitting with — and being deliberate about not rushing — is whether a token born from a meme can, over time, earn its way into genuinely useful financial infrastructure.

The finance-sector direction sketched here covers payments, cross-border remittances, and settlement rail exploration. These are real, solvable problems. Solana's throughput, sub-second finality, and low transaction cost make it a technically credible substrate for each of them. But technical credibility is not the same as institutional readiness, regulatory clearance, or a signed agreement with anyone. None of those things exist today for TrustTails. This section exists to name the ambition honestly — not to imply it has been achieved, or is imminent.

Transparency commitment: TrustTails will not claim any finance-sector partnership, affiliation, or integration until a signed, public agreement is in place. Any announcement prior to that standard should be treated as unverified. The community deserves that discipline.

Why Finance, and Why Later

Payments and remittances matter because they affect people who already live on thin margins — the exact people who were drawn to crypto's original promise of access without gatekeepers. If TrustTails is going to move beyond being a community asset and into being a useful one, that is the direction worth pointing toward. Settlement infrastructure matters because trust — the word in our name — is the single hardest input to manufacture in any financial system.

Phase 3 is deliberately placed last in the roadmap because the prerequisites are Phase 1 (a real, stable community) and Phase 2 (demonstrated governance and utility). Chasing institutional relevance before the community foundation is solid would be the fastest way to lose both. The ordering is intentional.

What we are exploring

Low-cost cross-border payment rails; peer-to-peer remittance corridors; SPL token settlement primitives on Solana. All at the research and design stage only.

What does not exist yet

No institutional partners. No regulatory approvals. No signed agreements. No pilot programmes. Any future claim to the contrary requires a verifiable public source.

The community foundation built in Phase 1 and Phase 2 is the launch point. Finance-sector relevance is the north star — a direction that guides decisions, not a confirmed destination.

The distance between the community node and that star in the diagram above is intentional. It reflects where we are — not where we are pretending to be. The work required to close that gap involves regulatory understanding, demonstrated reliability, and relationships that have to be earned over time. None of it can be shortcut by an announcement. That is precisely why we are naming this ambition now, at the beginning, rather than arriving at it later with inflated claims.

- Any finance-sector integration announced before a signed public agreement is unverified and should not be treated as fact.
- Phase 3 activity will only begin after Phase 1 and Phase 2 milestones are demonstrably met — not on a calendar schedule.
- The community retains visibility into this direction through governance mechanisms established in Phase 2.

SECTION 11 • THESIS

The Throughline

TrustTails started as a meme. That is not a disclaimer — it is the point. What a project does after the joke lands is where character is revealed.

The thesis running beneath everything in this whitepaper is simple and deliberately unromantic: the same properties that make a blockchain useful for a playful community token — transparent supply, immutable rules, verifiable ownership, no administrator who can move the goalposts — are the same properties that matter when the stakes are real. Whether TrustTails ever reaches financial utility is unconfirmed and contingent on execution that has not happened yet. But the architecture of trust does not need to be rebuilt to get there. It only needs to be demonstrated, incrementally, in public.

That is the throughline. Each phase is not a fundraiser or a product launch. It is a proof. Phase I proves that a community can form around honest communication and zero promises. Phase II proves that the team behind the token can ship something functional and keep commitments. Phase III, if reached, asks whether infrastructure built for transparency at the community scale can bear the weight of real financial use cases. No phase is guaranteed. Each depends on the previous one being done with integrity.

The TrustTails throughline: three sequential proofs, each contingent on the last.

The mint authority is revoked. The freeze authority is revoked. The supply is fixed at one billion tokens. These are not features that can be added later when trust is needed — they were baked in at launch, when no one was watching. That is the only kind of credibility that compounds.

This structure matters because it keeps the project honest. There is no narrative that skips Phase I because the community already believes, or that skips Phase II because the vision is compelling enough. Phases must be lived in sequence. A community that watches a team miss Phase II commitments has every right to walk away before Phase III is ever discussed. That accountability is not a risk to be managed — it is the mechanism that makes the thesis credible in the first place.

Whether TrustTails becomes something genuinely useful in finance or remains a community token is an open question. The answer will be written by what the team does next, not by what this document claims.

SECTION 12 • TRANSPARENCY

How We Communicate

Words are the cheapest thing a token team can produce. We are choosing to spend them carefully.

TrustTails started as a meme. That is not something we hide — it is something we say first, because how a project begins shapes every expectation that follows. What we are building after that starting point has to be earned through behaviour, not asserted through language. The way we communicate is where that commitment either holds or falls apart.

Intentions, Not Promises

When we describe where TrustTails is headed — a utility layer, a community standard for pet-finance transparency, longer-term ambitions in the financial sector — we are sharing our intentions. We are not making promises. There is a meaningful difference. An intention tells you what we are working toward and why. A promise implies a delivery date and a guaranteed outcome. We will not manufacture the latter when the reality is the former. If something we hoped to build turns out to be harder, slower, or wrong-headed, we will say that plainly rather than quietly pivoting and hoping nobody notices.

No Price Predictions. Ever.

We will not publish price targets. We will not share charts that imply trajectory. We will not say "to the moon," even jokingly in official channels, because jokes about returns are still claims about returns. The value of TAIL is determined by the people who hold it and the utility that is actually delivered. Our job is to build the latter honestly. Predicting the former is not our place — and attempting it would be the clearest possible sign that we are more interested in recruitment than in building.

We will announce partnerships only after a signed public agreement exists. Until that point, we will use the word "conversations" — not "partnerships," not "integrations," not "collaborations in progress." If we are talking to someone interesting, that is worth sharing. It is not worth dressing up as something it is not yet.

Correcting Mistakes Openly

We will make mistakes. Timelines will slip. A feature we described will work differently than we said. A decision we made will, in hindsight, have been wrong. When that happens, the correction will be as visible as the original statement. Not buried in a footnote. Not reframed as a pivot. Stated plainly, with an explanation of what changed and why.

This is not a novel concept — it is just rare enough in crypto that it feels like one. Honest communication is not a marketing position. It is the only basis on which a community built around trust can actually function. Every time a team overclaims and then quietly walks something back, they

borrow a little credibility from the future. We would rather start with less and accumulate it slowly than spend what we have not earned.

What we will say

- What we are building and why
- What is confirmed vs. still in progress
- When timelines change and the reason
- When we were wrong and what we learned

What we will not say

- Price predictions or return targets
- "Partnership" before a public agreement exists
- Allocation figures we have not confirmed
- Anything designed to create urgency around buying

Longer-lasting trust is not built by saying the right things at launch. It is built by still saying the same kinds of things two years later — when circumstances have changed, when some things have not gone to plan, and when it would be easier to spin than to be straight. That is the standard we are setting for ourselves now, while it is still easy to set it.

SECTION 13 • COMMUNITY

Community & Participation

TrustTails did not begin with a whitepaper. It began with a conversation — and that is still where everything of consequence happens.

Most tokens treat community as a distribution channel: a place to announce things, manage sentiment, and move price. TrustTails is trying to invert that. The community is not downstream of decisions — it is, to the extent we can make it so, where decisions get tested, questioned, and improved. That aspiration is easy to write and hard to sustain. We are at the very start of finding out whether we can.

Official Channels

At launch, TrustTails maintains two primary community spaces:

- **Telegram** — the main gathering point for day-to-day conversation, questions, and real-time updates. Link is pinned at the top of the official channel only.
- **X (Twitter)** — **@TrustTails** — public announcements, milestone posts, and the primary record of what the project has actually said vs. what others claim it has said.

These are the only two channels the core team operates. Any group, account, or individual claiming to represent TrustTails outside of these — offering allocations, early access, or support — is not affiliated with the project.

How to Take Part

Participation right now is straightforward: show up, ask honest questions, and hold the project to what it has written. The most valuable thing a community member can do at this stage is push back when something does not add up. Hype is easy to generate and easy to find. Scepticism that is accurate and fair is harder, and more useful.

There are no referral codes, no tiered roles with hidden benefits, and no mechanism to "get in early" through any channel other than buying on the open market once the token is live. If someone tells you otherwise, they are not telling the truth.

The Ethics We Are Trying to Hold

No paid promotion

The project will not pay influencers, callers, or communities to promote TAIL. If you see coordinated promotion from accounts with no prior connection to the project, treat it with appropriate scepticism.

Verify on-chain, not on trust

Contract address, mint authority revocation, freeze authority revocation — all of these are verifiable directly on Solana. We encourage every participant to check rather than take our word for it.

Official channels only

No moderator, team member, or affiliated account will ever DM you first, ask for your wallet details, or offer you anything outside the public channels listed above.

No presale, no allocation

TrustTails is pre-launch. There is no presale, no whitelist, and no way to acquire tokens before they are publicly available. Any claim to the contrary is a scam.

*The contract address is **4NoNV3jSYLRbUtVWSTK5XdkpuvRzGpMCmfZSBKMuk6Rc**.*

Verify it independently before interacting with any token that claims to be TAIL. One character changed is a different token entirely.

We are aware that writing these ethics into a document does not make them real. What makes them real — or does not — is whether the community holds the project to them over time, and whether the project responds honestly when it falls short. That is the only test that matters.

SECTION 14 • RISK

Risk, Compliance & Disclaimer

This document does not constitute financial, legal, or investment advice of any kind. Nothing written here should be read as a promise of profit, a guarantee of value, or a recommendation to buy, sell, or hold any asset.

TrustTails (TAIL) is a pre-launch community token on the Solana blockchain. It has no confirmed revenue model, no institutional backing, no exchange listing, and no guaranteed utility beyond what the community builds together over time. If you are considering acquiring TAIL tokens, you should consult a qualified financial and legal professional in your jurisdiction before doing so.

Participation in any token project carries the risk of total and permanent loss of funds. This is not a rhetorical disclaimer — it is a real and common outcome in this space. Do not commit funds you cannot afford to lose entirely.

Specific Risks to Understand

- **Market volatility.** Token prices can fall to zero quickly and without warning. Past performance of other tokens is not indicative of any outcome for TAIL.
- **Regulatory uncertainty.** The legal classification of SPL tokens varies by jurisdiction and is actively evolving. Regulatory action could restrict, prohibit, or materially affect the ability to hold or transfer TAIL in any given country.
- **Pre-launch status.** At the time of this whitepaper, TrustTails has not launched. All plans, timelines, and intended features described herein are statements of intent, not contractual commitments. They may change, be delayed, or not occur at all.
- **Smart contract risk.** While mint authority and freeze authority have been revoked, no smart contract or blockchain deployment is immune to undiscovered vulnerabilities or network-level risks on Solana.
- **No affiliations.** Any reference to industries, sectors, or use cases in this document reflects long-term community ambition only. No partnerships, integrations, or institutional relationships have been announced or confirmed as of this publication.
- **Liquidity risk.** There is no guarantee that a liquid market for TAIL will exist at any point. You may not be able to exit a position at a price you find acceptable, or at all.
- **Community dependency.** The value and utility of TAIL depends entirely on the continued participation of a voluntary community. Community interest can decline at any time.

Roadmap & Forward-Looking Statements

All phases, milestones, and product descriptions in this whitepaper represent current intentions only. They are not binding on the project or its contributors. Circumstances, resources, and community direction may cause material deviations from anything described here. Nothing in this document should be relied upon as a prediction or projection of future events.

Jurisdiction

This whitepaper is not directed at, and should not be relied upon by, persons in jurisdictions where the distribution of such material is restricted or unlawful. It is the sole responsibility of the reader to determine whether their participation is permissible under the laws of their jurisdiction. The team makes no representation that this document complies with local regulations in any specific country.

We started with a meme because honesty about where you begin matters more than projecting a credibility you haven't earned. Everything after that has to be built, step by step, in full view of the community. Trust is not claimed — it is earned. We mean that. Hold us to it.
